

More Clarity in the Dashboard. With Key Figure History and Action Integration.

Centralized Dashboard with Relevant Key Figures

Key figures are essential control tools for your company. They enable clear assessment of performance and focus attention on uncovering risks and opportunities. On top of that, they proffer aid for clearly specifying measurable targets and attaining the company's goals. With the Quality Cockpit, you always have the most important key figures clearly available on your screen.

With the new update, quality-relevant key figures from the Quality Cockpit are integrated into the centralized dashboard in BabtecQ R7 and displayed as a convenient overview. The advan-

tage in comparison with the Quality Cockpit is, among other elements, that QC key figures can be combined with other tile types here, such as statistics.

For an even better overview, you can work with individually configurable dashboards. And you get to choose whether you use the dashboard as a central information channel for all parties involved or as an overview for your to-do tasks, giving you a central point where you can immediately see which action is urgently needed.

In addition to list views and analysis tiles, key figures from the Quality Cockpit module are now also available for displaying on the dashboard.

Keep an Eye on How Your Key Figures Are Developing

To be able to predict risks and opportunities, including in the long term, you need to keep an eye on how your relevant key figures are progressing. Even large quantities of data will pose no difficulties in the future: In BabtecQ 7.2 you can save the current actual value of a key figure at a set interval and display its history. The software generates a curve for relevant key figures which shows whether a key figure has deteriorated or improved within a specific time period.

With the help of these key figure histories, you can monitor your processes and see whether they are running stable. In addition, you can see where action is needed at a glance.

The key figure history gives you a much-needed overview of your processes within your company.

In the detail area, you can see the past progress of the key figure in addition to its current evaluation.

Jump in Straight Away When Action Is Required

If a key figure history shows a need for action, e.g. if a key figure has worsened, appropriate actions can be implemented directly within the dashboard. These actions are then tracked and processed, thanks to integration into the central Action Management module. Information on the progress of implemented actions is always available on the dashboard.

You can see whether an action was effective and whether the key figure has improved again using the key figure history.

The combination of the key figure history and action integration supports you in building up an active risk management. You can monitor your processes using key figures and implement appropriate actions to combat any emerging risks quickly if needed.

All important information is available in a central location within the software as this has been integrated into the R7 dashboard.

Implement actions that will steer key figures in need of improvement down the right track with just a few clicks.

You can see whether your actions have had the desired impact by looking at the key figure history.
